

Academic Task No. 2

Q3: How java program is made persistent? What way would you design a GUI program using swing to enter a student name in one textbox and view the details of student in another textbox?

SET-2

Q1: Can you explain about thread life cycle? How would you describe multithreading? What way would you create a program to set thread priorities to 1, 5 and 10.

Q2: What way would you create a program which generate the threads:

- To display 10 terms of Fibonacci series.
- To display 1 to 10 in reverse order.

Q3: What facts would you select to show about Listeners and Events with reference to Java SWING components. Describe two types of application that might use it?

SET-3

Q1: “At certain point of time, it is necessary to terminate a thread before its task has been completed”. Justify your answer.

Q2: How would you compare the two ways of creating a thread in Java and the role of the start, run and stop methods?

Q3: The event-driven style of programming that is used in GUI programs is very different from the scripted, step-by-step programming that is often used for command-line applications. What facts would you select to show about event-driven programs and how they relate to object-oriented programming?

SET-4

Q1: Is it possible to achieve true parallelism using multithreading. What facts or ideas would you like to show?

Q2: Why creating a subclass of JFrame is preferred over creating an instance of JFrame when creating a window? What best approach would you refer to create a frame? Elaborate.

Q3: What is the role of priorities in multithreading. What are its limitations? How do you set and get priority values for threads in Java?

SET-5

Q1: How would you describe Interthread Communication? How you will use it to solve Producer consumer problem using a suitable program?

Q2: “Each thread may perform different tasks. Sometimes, it becomes necessary to suspend the execution of a thread for a period of time”. Justify your answer.

Q3: How would you define Event? Give examples of events. Define event handler and how it handles events?

SET-6

Q1: How java program is made persistent? What way would you design a GUI program using swing to enter a student name in one textbox and view the details of student in another textbox?

Q2: Can you explain about thread life cycle? How would you describe multithreading? What way would you create a program to set thread priorities to 1, 5 and 10.

Q3: “At certain point of time, it is necessary to terminate a thread before its task has been completed”. Justify your answer.

SET-7

Q1: How would you use synchronized keyword? What way would you design to display all running threads in Java?

Q2: What way would you create a program which generate the threads:

- To display 10 terms of Fibonacci series.
- To display 1 to 10 in reverse order.

Q3: The event-driven style of programming that is used in GUI programs is very different from the scripted, step-by-step programming that is often used for command-line applications. What facts would you select to show about event-driven programs and how they relate to object-oriented programming?

SET-8

Q1: Is it possible to achieve true parallelism using multithreading. What facts or ideas would you like to show?

Q2: How would you describe Interthread Communication? How you will use it to solve Producer consumer problem using a suitable program?

Q3: How would you define Event? Give examples of events. Define event handler and how it handles events?

SET-9

Q1: Why creating a subclass of JFrame is preferred over creating an instance of JFrame when creating a window? What best approach would you refer to create a frame? Elaborate.

Q2: “Each thread may perform different tasks. Sometimes, it becomes necessary to suspend the execution of a thread for a period of time”. Justify your answer.

Q3: What is the relationship between sleep () and wait () methods? How would you test with the help of examples?

SET-10

Q1: What is the role of priorities in multithreading. What are its limitations? How do you set and get priority values for threads in Java?

Q2: Define and differentiate the following pairs:

- (a) suspending and resuming threads
- (b) deadlock and stopping threads

Q3: The event-driven style of programming that is used in GUI programs is very different from the scripted, step-by-step programming that is often used for command-line applications. Discuss event-driven programs and how they relate to object-oriented programming.

List of Students:

Sr. No.	Reg. No.	Name	Roll No.	SET No.
1	12111790	Shivam Kumar Choudhury	RD2110A02	SET-1
2	12111810	Satyam	RD2110A03	SET-2
3	12112542	Kanav Jasrotia	RD2110A04	SET-3
4	12112743	Himanshi Gupta	RD2110A05	SET-4
5	12113075	Ankit Kumar Mishra	RD2110A07	SET-5
6	12113094	Ankit Kumar Soni	RD2110A08	SET-6
7	12110164	Vishal Ojha	RD2110A10	SET-7
